Advisory Circular

Guidance Material for Wildlife Hazards Management for Aerodrome Operator

FIRST EDITION
January 2018

BHUTAN CIVIL AVIATION AUTHORITY

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

FOREWORD

Bhutan as a Contracting State to the Convention on International Civil Aviation has an obligation to the international community to ensure that civil aviation activities under its jurisdiction are carried out in strict compliance with the Standards and Recommended Practices contained in the Annexes to the Convention on International Civil Aviation in order to maintain the required aviation standards.

As per the Bhutan Air Navigation Regulations section 14.5 part (e) requires to have a Wildlife Hazard Management System in place through conduct of necessary study/assessment of presence of wildlife (birds and animals) on and in the aerodrome vicinity which can pose serious threat to aircraft operational safety including assessment, recording and reporting of wildlife strike on aircraft.

It is expected that the aerodrome operator will be benefited by this guidance material as it provides an overall view of the Wildlife Hazard Management System.

.....
Director General
Bhutan Civil Aviation Authority

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

1. Introduction

1.1 Purpose

The aim of this guidance material is for the development of a Wildlife Hazard Management System to minimize the hazard to aircraft operations created by the presence of birds and/or animals on or in the vicinity of the airport.

2. Role and Responsibilities of Key Personnel

The role that each person or section assigned to the program will take it as crucial for execution and should be specifically outlined. Once assigned a role in the program each person or section must recognize and accept responsibility for certain functions to be carried out in order to accomplish program goals. Responsibility and accountability are interlinked. Although individuals must be accountable for their own actions, Chiefs, airport manager and supervisors are accountable for the overall performance of the group that reports to them. Chiefs are also accountable for ensuring that their subordinates have the resources, training, and experience needed for the safe completion of their assigned duties. The following paragraphs set to outline the roles and responsibilities of the members of the Wildlife Hazard Management Program.

2.1 Airport Manager

The airport manager is responsible to take any action deemed necessary to define and implement the wildlife management program and minimize wildlife hazards at the aerodrome. The airport manager must enforce the importance of the program.

The responsibilities includes:

- ✓ Make sure that all improvements and or modifications at aerodrome facilities are made in a timely fashion so buildings, structures, and storage areas do not provide shelter for wildlife
- ✓ Ensure all culverts and water run-off areas remain clear and provide drainage of accumulated water
- ✓ Ensure plants around any natural bodies of water are kept low and uninviting to visiting waterfowl
- ✓ Ensure vegetation on aerodrome is of such species that it will not be an attractant to hazardous wildlife
- ✓ Ensure grass is cut to required height
- ✓ Ensure any trees or foliage within 10 feet of perimeter fence is cut down to the ground or removed where feasible

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- ✓ Ensure all newly assigned personnel receive training on runway inspection procedures and how to make wildlife observations
- ✓ Collect daily inspection forms and report any abnormal wildlife observances immediately to SMS manager

2.2 SMS Manager

The responsibilities includes:

- ✓ Act as Wildlife Coordinator for the Aerodrome
- ✓ Management and annual review of the Wildlife Hazard Management Plan.
- ✓ Conduct a wildlife hazard assessment at least every four years or sooner when required by triggering event or special circumstances
- ✓ Ensure methods in place to monitor wildlife levels on a daily basis
- ✓ Collect, analyze, record and submit required reports to concern authority of any instance of bird or wildlife strikes utilizing the form in Appendix I, Form 1
- ✓ submit report to BCAA for inputting the appropriate information into the ICAO Bird Strike Information Database (IBIS)
- ✓ Ensure that staff are trained, qualified and competent to discharge their duties under the wildlife hazard management program;
- ✓ Liaise with all pertinent government agencies to facilitate wildlife control off site that could have potential effect on aerodrome operations
- ✓ Organize participation and facilitate meetings of the wildlife hazards working group as needed and maintain the associated records and action items;
- ✓ Ensure breaches to the perimeter fence are identified immediately to engineering division to make every attempt to expedite repair or increase security patrols in the area until repair can be effected
- ✓ Ensure any animal traps around the perimeter fencing during the inspection and record, analyse and notify.
- ✓ React to and remove immediately any wildlife reported to be on runway or taxiway on the aerodromes during airport operating hours

2.3 ATC

The responsibilities includes:

- ✓ Ensure constant monitoring of wildlife levels in aircraft maneuvering area and its associated facilities and report any wildlife hazards to airport manager and SMS manager
- ✓ Ensure methods in place for immediate and continuous update of wildlife hazard information to all pilots, making sure there is sufficient time from notification to ensure safe operation of aircraft

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- ✓ Attend meetings of the project implementation group and coordinate engineering division input on all construction projects which could have an impact on wildlife levels on aerodrome, paying particular attention to any projects in the obstacle limitation surfaces or within 13 km of the centre of the runway
- ✓ Ensure all newly assigned personnel receive training on runway inspection procedures and how to make wildlife observations;

2.4 Engineering division

The responsibilities includes:

- ✓ Make sure that all new construction, improvements and or modifications at aerodrome facilities are made in a timely fashion so buildings, structures, and storage areas do not provide shelter for wildlife;
- ✓ Ensure all culverts and water run-off areas remain clear and provide proper drainage of accumulated water;
- ✓ Ensure all newly assigned personnel receive training on runway inspection procedures and how to make wildlife observations
- ✓ Collect daily inspection forms and submit to airport manager or sms manager weekly. Report any abnormal wildlife observances immediately to sms manager or airport manager

2.5 Finance division

The responsibilities includes:

- ✓ Manage budgetary responsibilities for mitigation of wildlife;

2.6 Wildlife Control Group

The responsibilities includes:

- ✓ incorporate current scaring and deterrence techniques for wildlife which present a hazard to aircraft operations
- ✓ develop trapping and removal procedures for hazardous wildlife on aerodrome
- ✓ Establish and maintain training guidelines for qualification of all parties involved in Wildlife Hazard Management System.
- ✓ Ensure proper documentation of all wildlife control activities and provide said documentations to authority for interpretation and filing.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

2.8 Wildlife Hazards Working Group

The responsibilities includes:

- ✓ identify hazardous wildlife attractants on or near the aerodrome;
- ✓ formulate mitigation strategies and policies to reduce the amount of hazardous wildlife present on the aerodrome;
- ✓ create media releases to inform general public of wildlife mitigation strategies and effectiveness of same
- ✓ Meet to review the airports Wildlife Hazards Management Plan at least annually
- ✓ Meet as soon as possible following a Wildlife Hazard triggering event to review Wildlife Hazard Management Plan and recommend any immediate modifications for improvement
- ✓ Prepare reports and make recommendations for all wildlife matters.

This group will consist of representation from the following entities at a minimum:

- ✓ Airport Safety, Air Navigation Services, Operations, Engineering and Security divisions
- ✓ Airline operations
- ✓ RFFS;
- ✓ Representatives from concerned Government Agencies

3 Elements of the Management Program

The Wildlife Hazard Management Program consists of the following elements:

3.1 Wildlife Hazard Assessment

In accordance with aerodrome manual, the aerodrome operator must take immediate action to alleviate wildlife hazards whenever they are detected. After any **triggering event** (as described in paragraph 3.2 below) or at any time deemed necessary by the airport manager, the aerodrome operator should conduct a wildlife hazard assessment.

The wildlife hazard assessment must contain at least the following:

- a) An analysis of the events or circumstances that prompted the assessment;
- b) Identification of the wildlife species observed and their numbers, locations, local movements, and daily and seasonal occurrences;
- c) Identification and location of features on and near the airport that attract wildlife

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- d) A description of wildlife hazards to airlines
- e) Recommended actions for reducing identified wildlife hazards to airlines

3.1.1 Triggering Events

The following is a list of triggering events that would call for a wildlife hazard assessment and a review of the procedures in the Wildlife Hazard Management Plan:

- a) An aircraft experiences multiple wildlife strikes
- b) An aircraft experiences **substantial damage** from wildlife strike. As used in this paragraph, substantial damage means damage or structural failure incurred by an aircraft that adversely affects the structural strength, performance, or flight characteristics of the aircraft and that would normally require major repair or replacement of the affected component;
- c) An aircraft experiences an engine ingestion of wildlife
- d) Wildlife of a size, or in numbers, capable of causing an event described in paragraphs a), b), or c) of this section is observed to have access to any airport flight pattern or aircraft movement area.

3.2 Surveillance

Intelligence gathering is an essential component of the wildlife hazard management program and involves the monitoring of all potential attractants, concentrations and movement patterns of hazardous species, both on and in the vicinity of the aerodrome.

Physical inspections of the movement area and other areas critical to wildlife hazard management must be done sufficiently in advance of air operations to allow time for wildlife mitigation to be effective. Coordination between the various groups and organizations on an airport is essential for good wildlife control.

Airport Operations, grounds and maintenance departments, airport fire service, airport restaurants, airport planners and airlines all have a role to play in identifying and correcting wildlife problems. Surveillance for wildlife is to be maintained throughout Airport operating hours as follows:

3.2.1 Air Traffic Control

Air traffic control personnel must report any unsafe conditions, including hazardous wildlife on or near the Aircraft Operating Area to the SMS manager or airport manager anytime such conditions are observed and ensure a logbook entry is made to that effect.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

3.2.2 Pilots and Aircrew

If an aircrew observes or encounters any bird activity while in flight, which could constitute a hazard, the aircrew are to contact ATC and request that the observed bird activity be passed on to the airport manager or SMS manager.

The following information is necessary:

- a) Call sign;
- b) Location;
- c) Altitude;
- d) Time of sighting;
- e) Type of bird (if known);
- f) Approximate number of birds;
- g) Behaviour of birds (soaring, flying to or from a location, etc)

3.2.3 Airport Tenants

Fixed-based operators, catering services, and airport tenants must ensure their actions do not create hazardous wildlife attractants. If at any time their actions create a hazardous wildlife situation they are to report this to the wildlife SMS manager or airport manager immediately and take steps to remedy the situation.

3.2.4 Airline Operators

It is the responsibility of the airline operators to participate in the wildlife control programmes since it is the aircraft and the travelling public that the airport authorities are protecting. Through the operating of wildlife control programmes, airport authorities are assisting in making air travel safer.

In some cases, it is believed that an absence of bird strike reports is not due to strikes not occurring but is because fixed base aircraft operators, and the general aviation community, are failing to report them. Efforts to increase the involvement of the aircraft operators in bird strike reporting programmes will help increase reported strikes.

3.3 Wildlife Identification

It is difficult to establish whether a species of bird is a hazard to aircraft. A general survey of the number of birds which pass over the site during migration, other bird populations and their movements in the area of the airport itself and in its vicinity should be carried out first as a baseline data and then on a regular manner. Bird species inhabiting the open landscape are a greater hazard to aircraft than species living mostly in woodland areas.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- 3.3.1** Any bird, even a small one, has the potential to cause major damage to an aircraft. The larger the bird, the greater the damage is expected to be from a single strike. There is also a greater likelihood of a strike if there is a great number of birds of the same species. Birds that fly at high altitudes are still a threat since their point of arrival or departure may be near the airport site. Therefore, birds which represent a great threat to aircraft are large birds and flocking birds, while large, flocking bird species are the greatest threat.
- 3.3.2** While it is difficult to drive all birds from an airport at all times, every reasonable effort to do so is crucial. Any bird is a potential hazard. This is especially true as bird numbers and bird size increase and as the faster and quieter new generation turbine-engine aircraft become more numerous. Airport personnel and committee members must examine bird strike records so that the determination of the high risk species at the site is possible.
- 3.3.3** The collection of all available statistics for the site is important, including bird strike reports, type of aircraft, and number of aircraft movements. By analysing this data, the determination of the bird species most hazardous will occur. The reporting of bird strikes and the preparation of a summary of the reports must occur as well.
- 3.3.4** In a large portion of bird strike reports, there is no mention of the species. This is often because no remains are found for identification. If a strike has occurred, the pilot can usually give some idea of the size of the bird involved be it small (sparrow), medium (gull), or large (goose). This information can assist in identifying the hazard. Identification of birds by an ornithologist is possible from even quite small specimens of feather. Universities and museums can usually assist in the identification of birds from the remains. It is therefore important for pilots, airport ground staff, aircraft maintenance staff, etc. to ensure that any remains, including feathers, are properly identified.

3.4 Habitat Management and Site Modification

Controlling the attractiveness of an airport to birds and other wildlife is fundamental to good wildlife control. In fact, it is probably more important than dispersal techniques in terms of controlling the overall risk. If the reason for frequenting the airport is not removed or diminished the wildlife will continue to try and return no matter the consequence. Therefore it is necessary to first identify the species that represent a hazard and learn about their habits and seasonal trends. At the same time a survey of the aerodrome should be performed under scientific conditions to identify what attractants are causing the species to continue to frequent the aerodrome and a plan for mitigation must be prepared. Habitat improvement, such as improving drainage, and modifying vegetation cover is frequently expensive and may take a number of years to fully implement, and the benefits of which are not always immediately apparent.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

Commitment to the process from senior managers is therefore essential and all must understand the program goals and long term objectives. In the meantime wildlife will find their way to the airport for a number of reasons. Sometimes those reasons are obvious and sometimes not so obvious. However, the most prevalent reasons can be as simple as the essentials for life such as **food, water and shelter.**

- 3.4.1 Food-** It would be very difficult to remove all food sources on an aerodrome. As grass is the common vegetation on an aerodrome, grassland management has an important influence on the amount of animals and insects present either looking for food or providing a food source. All measures such as mowing and digging must be closely monitored and executed in a timely fashion not to act as an attractant during critical aircraft movement times. Projects such as refuse dumps and wildlife preserves should be studied carefully to determine their feasibility and the effect they will have on existing wildlife levels at the aerodrome.
- 3.4.2 Water-** Surface water is attractive to all species, and on airport property it should appear as little as possible. In cases where river, ponding, are present it is possible to cover them with wires or netting or floating balls to make them less attractive to visiting birds. Drainage ditches or culverts can clog up with vegetation or eroded soil therefore impeding the flow of water. Insect and aquatic-life flourish in clogged ditches. Clearing the ditches and culverts on a regular basis is important to reduce this from occurring. They should also be properly graded to draw water away from the runway surfaces as rapidly as possible. Grass and other vegetation should be cut on the sloping banks.
- 3.4.3 Shelter-** Many forms of wildlife often seek shelter on airport property, whether it is a few hours a day or a few days a week this can present a serious hazard to aircraft safety. The most obvious attractant is the fact that an aerodrome provides a flat, well-groomed area which affords a clear view in all directions. Wildlife can search for food and often have great visibility on any approaching predators. The asphalt from the operating surfaces also provides a nice warm brooding area in the evening hours. The type of trees, shrubs, and landscaping plants used on the aerodrome can also act as an attractant especially in the case of fruit trees. It is a very typical practice to control the height of grass present on the aerodrome in order to make the aerodrome less attractive to birds. Most birds dangerous to aircraft prefer short grass. That is why it is recommended that grass be maintained at a height of 20 cm or more. By allowing grass to grow to a height of 20 cm or more, birds do not have good visibility and feeding is hindered.
- 3.4.4 Grass Management-** The most effective habitat control measure that can be applied on an aerodrome is the management of the grassed areas. Short grass can provide security by enabling smaller birds to see over the wider spaces of the aerodrome for early warning of approaching dangers. It also increases populations of invertebrate animals on which many bird species rely for food. Short grass therefore does not deter most species of aerodrome birds and should be avoided.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

Conversely, long grass (typically above 40 cm) that falls over because it cannot support itself also has the potential to attract birds. Grass maintained at a height of 15 to 20 cm makes it difficult for birds to locate prey at or below the surface, spoils the security effect, and reduces populations of soil invertebrate food sources.

3.5 Hazardous Wildlife Dispersal Methods

Habitat modification can be a very slow process. For the most part a few quick changes will produce results but in the long run the majority of the habitat modifications will have to take place over extended periods of time. Even when all facets of habitat modification are in place or completed there will still be a need to deter wildlife from the aerodrome. There are various dispersal methods and they all carry different levels of success. Even the most useful methods at a certain time will not work at other times. And **if used too often the same dispersal method can become totally ineffective**. In most cases it is effective to use a combination of more than one method and by varying the approach used and the combination of scare techniques its effectiveness can be increased. In the case of birds for instance, continual harassment has been found to drastically reduce the amount of bird population on the aerodrome.

The following paragraphs are a description of some widely used and accepted dispersal methods:

- 3.5.1 Auditory Deterrents-** include both natural and man-made sounds to scare the wildlife away. When deploying any of these tactics it should be noted that well devised strategies should be thought out first to avoid scaring the birds or other wildlife into the path of the airplanes. Some methods include; gas cannons, pyrotechnics, distress calls, and calls of predators.
- 3.5.2 Visual Deterrents-** are props or replicas of the real predators. It should be noted that while this is a good method for transient birds it would not work for very long. Habituation is the real problem here. The wildlife or birds get used to seeing the visual deterrent and therefore it no longer has the same effect. Some examples include; scarecrows, flags and streamers, lights, predator models, hawk kites, and gull models.
- 3.5.3 Barriers-** since airports often contain the necessities of life- food, water, and shelter- any way of restricting access to any of these bare essentials would have the effect of causing the wildlife to find a different place to go where they are available unrestricted. Some examples include; netting, fencing and guards, and nail strips.
- 3.5.4 Traps-** In the case of protected species or species with a high public profile it is better to capture the wildlife alive for transport to a release area off the airport. The main drawback is that live trapping can be very costly and time consuming. Trapping many species of wildlife requires knowledge of the animals' habits and skill in placement of the traps and use of baits.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

3.5.5 Falconry- The use of predatory birds such as falcons, hawks, or owls to drive away rodents and birds from the aerodrome. The technique is considered highly expensive and requires a lot of training, planning and strategy. It also comes with the risk of the bird actually becoming a hazard.

3.5.6 Canine Harassment-

The use of a trained dog, released on the airside surfaces to chase and harass birds.

3.6 Aircraft Flight Schedule Modification

Although not generally practical for regularly scheduled commercial traffic, flight schedule adjustments might be possible in some situations. Such changes can lessen the chance of a strike with a wildlife species that has a predictable pattern of movement (i.e. - nocturnal feeding habits of large birds).

Air traffic control personnel may also not allow departures or arrivals around the peak bird traffic times of sunrise and sunset. While seemingly practical, this technique may be very disruptive to airports where traffic is constant and even a short-period runway closure would cause substantial delays.

3.7 Land Use around Airports

Regulations should be placed on the use of lands surrounding airports to reduce their attractiveness to birds and other types of wildlife. Airports should conduct an inventory of bird attracting sites within the ICAO 13Km bird circle, paying particular attention to sites close to the airfield and the approach and departure corridors. Where laws permit, airports, or airport authorities, should seek to have an input into planning decisions and land use practices within the 13Km bird circle for any development that may attract significant numbers of hazardous birds/wildlife. By definition an “on airport” bird strike is that which occurs between 0 to 60 m (inclusive) on landing and 0 to 150 m (inclusive) on take-off.

Land use which have caused specific problems at airports are: fish processing, garbage dumps and landfill sites, theatres and food outlets, wildlife refuges, artificial and natural lakes and ponds, golf courses, animal farms and slaughter houses. Prior planning is necessary to ensure that incompatible land uses are not allowed to become established. It is clear that robust habitat management and active bird control measures employed within airports need to be used beyond the airport boundary. Farmers need to carefully consider the air safety impact that particular land use choices may have.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

3.8 Risk Management of Wildlife Hazards

Before any risk assessment can be conducted with any degree of accuracy, the level of ambient wildlife risk, which is the level and type of wildlife activity that would occur in the absence of any monitoring or control measures, should be determined. This level provides a measure against which to assess the effectiveness of the plan. Details of existing wildlife locations and wildlife movements relative to those locations and the aerodrome will need to be ascertained, both to establish an accurate database and to keep the information flow current. A risk assessment should therefore be conducted initially to provide a quantifiable benchmark and repeated thereafter on a periodic basis.

A typical risk assessment process may involve:

- a) A detailed hazard description, identifying wildlife species and associated habitats that influence the size and behavior of the species populations in the area;
- b) An assessment of the probability of a wildlife strike with a particular species, taking into consideration the current mitigation procedures in place and seasonal factors;
- c) Consideration of the species involved including size and numbers, an assessment of the likely severity of the outcome of a wildlife strike;
- d) An assessment of the frequency of serious multiple strikes;
- e) The determination of the acceptability of the level of risk by summing the probability and severity, based on a probability/severity matrix of SMS.
- f) The identification of further risk management options available; and
- g) The development or modification of an action plan to eliminate, reduce or mitigate unacceptable risks.

4 Animal Hazards

- 4.1 Animals are normally prevented from entering airside by keeping gates shut and maintaining the integrity of the boundary fence. However, if animals do gain entry to airside, Control Tower should be advised immediately and the animals removed as soon as possible. Should the problem be beyond the scope of airport staff, then special assistance will be called e.g. animal husbandry or forest wildlife/park services etc.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- 4.2 Airport staff pursuing animals adjacent to aircraft movement areas will take reasonable steps to ensure that their actions do not frighten animals into the path of an approaching aircraft.
- 4.3 Firearms will be used only as a last resort to harass animals away from the movement area. Public and airport staff sensitivities are always to be considered and animals will not be destroyed unless there is immediate danger to essential facilities or to the safety of an aircraft.

5 Livestock Transfers

- 5.1 The provisions of the following instructions will be applied for the safe transfer of livestock between the landside of Airport and an aircraft, or vice versa. These requirements do not apply to domestic pets normally consigned through freight companies or airline check-in.
 - 5.1.1 For livestock transfer where stock is not containerized, only positions designated by the Airport Operations Supervisor will be approved. In such cases livestock transfers will wherever possible be remote from other aircraft operations.
 - 5.1.2 For all livestock transfers the airport manager or BARRA or ground operation manager will be the contact point for the aircraft ground handler.
 - 5.1.3 The airline operator or aircraft ground handling agent shall inform the airport manager or BARRA of any proposed livestock transfer, giving reasonable prior notice. Written notification must include shipment and flight details.
 - 5.1.4 Where the livestock transfer to/from airline containers is to take place on the Airport, this activity should be confined to a landside area. Where this is not possible for any reason, the operator or agent must provide a secure race to convey livestock between the land transport and the aircraft door, to minimize the risk of livestock escaping airside.
 - 5.1.5 Where this method of transfer is to be used the operator or agent is to provide details of the proposed equipment and procedures. These details must be faxed to the airport manager or BARRA at least 7 days prior to the proposed shipment. The Airport ground operation manager will impose any conditions required to maintain the safety of aircraft operations.
 - 5.1.6 Ground operation manager will be present during the loading or unloading of such livestock to or from aircraft. He will maintain radio contact with Control Tower at all times.

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- 5.1.7 Should livestock escape either on airside or landside the operator/agent shall immediately notify the Airport Manager, and take immediate action to recapture it. If airside this is to be under supervision of the airport manager/ground operation manager , who will provide assistance. If landside, the operator/agent shall take immediate action to ensure the safety of the public. The Airport Manager, will provide assistance wherever possible, and issue any directions considered necessary.
- 5.1.8 On completion of the livestock transfer, the ground operations manager or BAFRA?SMS manager are required to ensure that the operator/agent leaves the apron and loading areas in a clean and serviceable condition.
- 5.1.9 Operator/agent are required to ensure compliance with all relevant non-aviation legislative requirements for the handling and transport of livestock.

6 Training for Airport Personnel Actively Involved in Implementing Wildlife Hazard Management Plans

6.1 Training Requirement Outline.

The goal of the training course must be to provide the knowledge, skills, and abilities needed by airport personnel to safely, accurately, and effectively implement relevant portions of an approved Wildlife Hazard Management Plan. That should include:

- 6.1.1 General survey of wildlife hazards to aviation based on the most recent annual Wildlife Strike Database Report.
- 6.1.2 Review of wildlife strikes, control actions, and observations at the airport over at least the past 12 months
- 6.1.3 Review of the airport’s Wildlife Hazard Assessment is to include:
 - a) Existing wildlife hazards and trends in wildlife abundance
 - b) Status of any open or unresolved recommended action items for reducing identified wildlife hazards to air carrier operations within the past 12 months
- 6.1.4 Review of the airport’s Wildlife Hazard Management Plan, to include the following:
 - a) Airport-specific wildlife attractants, including man-made and natural features and habitat management practices of the last 12 months.
 - b) Review of other airport-specific items:

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- c) Wildlife hazard management strategies, techniques, and tools:
 - (i) Flight schedule modification
 - (ii) Habitat modification, exclusion
 - (iii) Repelling methods
 - (iv) Wildlife population management

- d) Responsibilities of airport personnel for:
 - (i) Reporting wildlife strikes, control actions, and wildlife observations
 - (ii) Communicating with personnel who conduct wildlife control actions or who see wildlife hazards and air traffic control tower personnel and others who may require notification, such as airport operations or maintenance departments
 - (iii) Documenting and reporting wildlife hazards seen during patrols and inspections and follow-up control efforts
 - (iii) Documenting and reporting when no hazards are seen during patrols and inspections

- e) Basic bird and mammal identification, stressing local hazardous and rare or endangered species of concern

- f) For any airport personnel using pyrotechnic launchers or firearms, training on the following topics from a qualified individual/institute:
 - (i) Safety, parts, and operation of pyrotechnic launchers
 - (ii) Fundamentals of using pyrotechnics to safely and effectively disperse wildlife
 - (iii) Personnel protective equipment
 - (iv) Cleaning, storage, and transport of firearms and pyrotechnic launchers
 - (iv) Applicable local regulations on firearms, pyrotechnic launchers, and pyrotechnics
 - (v) Live fire training with pyrotechnic launchers including strategies for dispersing wildlife away from runways and aircraft movement corridors
 - (vi) For any airport personnel using firearms, local regulations applies but this training is not a requirement for this training program.

7 The Wildlife Control Programme Evaluation

	Bhutan Civil Aviation Authority	Advisory Circular(AC) BCAA-AC-AGA-007 January 2018
---	--	---

- 7.1** The following questions are directed at airport management — specifically the airport manager — and are designed to assist in determining if there is an effective wildlife control programme in place at an airport.
1. Has a wildlife control programme been developed?
 2. Has the wildlife control programme been implemented?
 3. Has a wildlife control officer at the site been appointed and responsibilities assigned?
 4. Has a training programme been developed to train those involved in the wildlife control programme?
 5. Has a wildlife control co-ordinating committee been established with well defined responsibilities?
 6. Has a reporting procedure been developed covering all aspects of the wildlife control programme?
 7. Has a land use plan been established with regard to effective land use on and off the airport as it pertains to the bird control programme?
 8. Has a list of all wildlife attractants at the site been completed?
 9. Has a list of all wildlife attractants surrounding the airport been completed?
 10. Have wildlife control methods been researched and implemented at the airport?
- 7.2** If the answer to any one of these questions is “NO”, an effective wildlife control programme may not be in place at the airport.
